
EMAP Technical Report

IIP extension for Woolz sectioning

Author: **Zsolt Husz**
Email: Zsolt.Husz@mrc.ac.uk
Date: **October 20, 2008**
Distribution: **Open distribution is permitted**
Status: **Draft**
Source: **Report/000024-WlzIIPSrv**
Project: **NIH**
Report number: **EMAP/Report/000024**
Keywords: **IIPServer, Woolz, sectioning, WlzIIPSrv**

Abstract

WlzIIPSrv extends the IIP protocol to provide 2D section views of 3D Woolz objects. This document describes the extensions for both the user of the WlzIIPSrv and for its developers, summarising the changes performed.

1 Introduction

The IIP protocol provides quick access to large image databases. However in the Mouse Atlas project 3D objects are represented as Woolz objects not as flattened images. Therefore a service is needed providing specific sections of an object. The WlzIIPSrv server provides this based on a previous IIP server implementation, the IIPSRV. This document assumes understanding of the IIP ([I3A, 1997](#)).

For clarity, in the rest of this document IIPSRV will refer to the original server, with code version 0.9.7 ([Pillay and Pitzalis, 1997](#)), WlzIIPSRV will refer to the extended server, while IIP will point to the protocol standard of [I3A \(1997\)](#).

The coordinate system convention used in this document is shown in Figure 1. The object coordinate is defined by the object and the section coordinates result after sectioning. Then, the translated section coordinates with the section's minimum at (0, 0) are the display coordinates. Further, the section is divided into non-overlapping tiles covering the whole section. Tiles are numbered with 0, 1, 2, etc., with the 0th coordinates matching the display coordinates. The 1st, 2nd, etc. tiles continue from left to right and top to bottom. A client can visualise a section with reduced viewing area. This has the view coordinates and is client dependent.

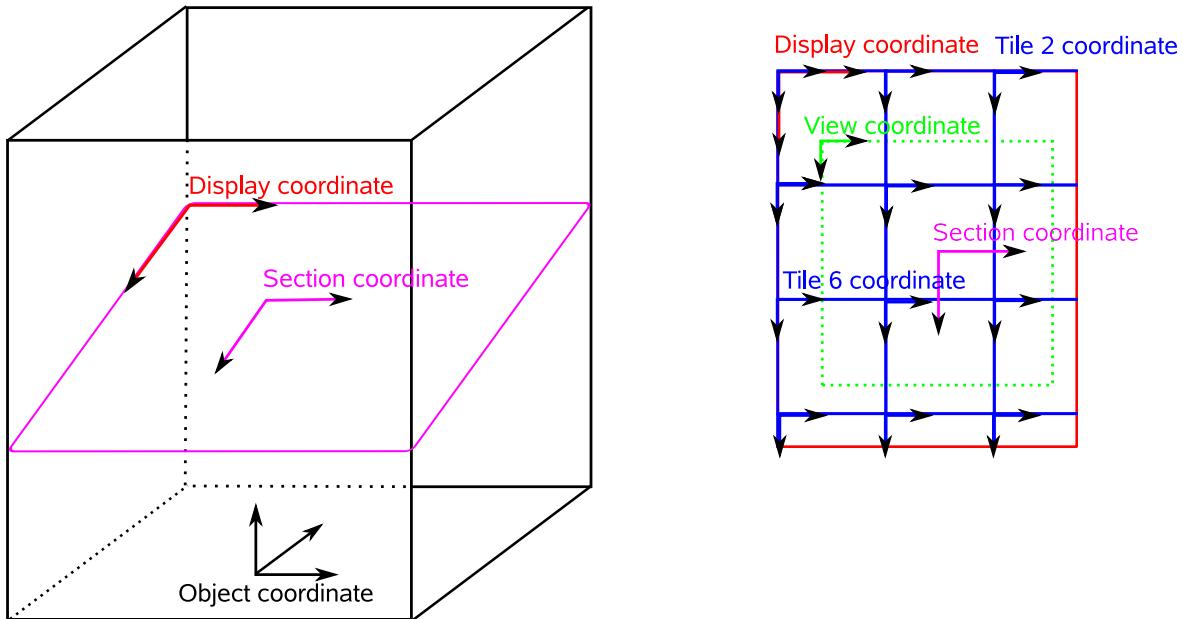

Figure 1: Coordinate systems

2 Extension overview

In addition to the IIPSRV commands, a WlzIIPSRV command specifies an object, sets the viewing section parameters and requests image or meta data of the object. Tile requests are similar to the TIFF requests, however for a Woolz object the resolution number used in **JTL/TIL** is ignored.

The extended command list that sets query parameters are summarised in Table 1, while Table 2 shows the new objects that may be queried with the **OBJ** command.

Command	Purpose	Syntax
WLZ	Specify the Woolz object	WLZ = <i>path</i>
DST	Specify the distance of the sectioning plane	DST = <i>dis</i>
FXP	Specify the fixed point of the viewing section rotation	FXP = <i>X, Y, Z</i>
FXT	Specify the second fixed point of the viewing section rotation	FXT = <i>X, Y, Z</i>
MOD	Specify the projection mode	MOD = <i>mode</i>
PIT	Specify the pitch angle of the sectioning rotation	PIT = <i>angle</i>
PAB	Specify the 3D query point absolute in the object coordinate	PAB = <i>X, Y, Z</i>
PRL	Specify the 2D query point relative in tile or display or tile coordinate	PRL = <i>T, X, Y</i>
ROL	Specify the roll angle of the sectioning rotation	ROL = <i>angle</i>
SCL	Specify the scale used in the sectioning transformation	SCL = <i>scale</i>
UPV	Specify the up vector for the UP_IS_UP mode	UPV = <i>X, Y, Z</i>
YAW	Specify the yaw angle of the sectioning rotation	YAW = <i>angle</i>

Table 1: Extended command overview

Object	Purpose
IIP-server	Identify if WLZ-IIP is running
Max-size	The size of the section
Tile-size	The size of a tile
Wlz-true-voxel-size	The voxel size of the object
Wlz-volume	The volume of the object
Wlz-distance-range	The range of the sectioning plane distance
Wlz-sectioning-angles	The pitch, yaw and roll angles of the sectioning plane
Wlz-3d-bounding-box	The first and last plane, line and column number of the object
Wlz-coordinate-3D	The 3D coordinates defined in 2D by the PRL command
Wlz-grey-value	The grey or RGB value of a point specified either the PRL or the PAB commands

Table 2: Extended object overview

2.1 Woolz object specification

WLZ	Purpose	Specify the Woolz object. It is similar to the FIF command, however instead of loading Pyramidal Tiled TIFF images, it specifies a Woolz object. Compared with FIF , the Woolz object is not loaded until a later operation requires this. The Woolz objects are cached.
	Syntax	WLZ = <i>path</i>
	Input Parameters	PATH <i>path</i> Full path of the Woolz object.
	Response	WLZ returns nothing when accompanied by other commands
	Example	⇒WLZ=/net/homehost/export/home/bill/pics/lobster3d.wlz
	Notes	Equivalent if FIF (I3A, 1997 , p.25)

2.2 Setting sectioning and query parameters

The next commands are optional and can be used in any combination.

DST	Purpose	Specify the distance of the sectioning plane
	Syntax	DST = <i>dis</i>
	Input Parameters	FLOAT <i>dis</i>
		The distance to the sectioning plane
	Response	none
	Example	⇒DST=12.5
	Default value	0.0
FXP	Purpose	Specify the view rotation fixed point in the object coordinate system.
	Syntax	FXP = <i>X,Y,Z</i>
	Input Parameters	FLOAT <i>X</i>
		The x coordinate
		FLOAT <i>Y</i>
		The y coordinate
		FLOAT <i>Z</i>
		The z coordinate
	Response	none
	Example	⇒FXP=10.5,20,15.0
	Default value	0.0,0.0,0.0

FXT	Purpose	Specify the second fixed point in the object coordinate system of the viewing section rotation used only with MOD=FIXED_LINE.
	Syntax	FXT=X,Y,Z
	Input Parameters	FLOAT X The x coordinate FLOAT Y The y coordinate FLOAT Z The z coordinate
	Response	none
	Example	$\Rightarrow FXT=30,-20.2,15.0$
	Default value	0.0,0.0,0.0
MOD	Purpose	Specify projection mode.
	Syntax	MOD=mode
	Input Parameters	$mode \in \text{STATUE} \mid \text{UP_IS_UP} \mid \text{FIXED_LINE} \mid \text{ZERO_ZETA}$ ZETA The projection mode
	Response	none
	Example	$\Rightarrow MOD=\text{FIXED_LINE}$
	Default value	UP_IS_UP
PIT	Purpose	Specify the pitch angle of the sectioning rotation
	Syntax	PIT=angle
	Input Parameters	FLOAT angle rotation angle in degrees
	Response	none
	Example	$\Rightarrow PIT=180.0$
	Range	0.0–180.0
	Default value	0.0
PAB	Purpose	Specify a 3D query point absolute in the object coordinate system.
	Syntax	PAB=X,Y,Z
	Input Parameters	FLOAT X The x coordinate FLOAT Y The y coordinate FLOAT Z The z coordinate
	Notes	If both PRL and PAB are specified then PRL has priority of feature queries
	Response	none
	Example	$\Rightarrow PAB=200,-50,30$

PRL	Purpose	Specify a 2D query point relative to tile or display coordinate system.
	Syntax	<code>PRL=T,X,Y</code>
	Input Parameters	<p><code>RANGE T</code> The T tile number</p> <p><code>RANGE X</code> The x coordinate</p> <p><code>RANGE Y</code> The y coordinate</p>
	Notes	<code>PRL</code> either specified a coordinate in a given tile, or if the tile number <code>T=-1</code> then in the display coordinates
	Response	none
	Range	<code>T=-1 .. maxtile</code>
	Example	<code>X,Y</code> are limited to the tile or section size <code>⇒PRL=2,20,1</code>
	Default value	none
ROL	Purpose	Specify the roll angle of the sectioning rotation
	Syntax	<code>ROL=angle</code>
	Input Parameters	FLOAT <code>angle</code> rotation angle in degrees
	Response	none
	Example	<code>⇒ROL=20.0</code>
	Range	0.0–360.0
	Default value	0.0
SCL	Purpose	Specify the scale used in the sectioning transformation.
	Syntax	<code>SCL=scale</code>
	Input Parameters	FLOAT <code>scale</code> the scale. A values over one is up, while lower than one is down-scaling.
	Response	none
	Example	<code>⇒SCL=2.5</code>
	Range	positive
	Default value	1.0
UPV	Purpose	Specify the up vector for the UP_IS_UP mode.
	Syntax	<code>UPV=X,Y,Z</code>
	Input Parameters	<p>FLOAT <code>X</code> The x component</p> <p>FLOAT <code>Y</code> The y component</p> <p>FLOAT <code>Z</code> The z component</p>
	Response	none
	Example	<code>⇒UPV=0,-1,2</code>
	Default value	<code>0.0,0.0,-1.0</code>

YAW	Purpose	Specify the yaw angle of the sectioning rotation.
	Syntax	<code>YAW=angle</code>
	Input Parameters	FLOAT <i>angle</i> rotation angle in degrees
	Response	none
	Example	<code>⇒YAW=2.0</code>
	Range	0.0–360.0
	Default value	0.0

2.3 Extended object reference

IIP-server	Purpose	Identify if WlzIIPSrv is running.
	Syntax	<code>IIP-server</code>
	Response	<code>IIP-server:255.552255</code>
	Example	<code>⇒OBJ=IIP-server</code> <code>⇐IIP-server:255.552255</code>
	Note	This object should be used to verify if the IIP server has Woolz sectioning capabilities
Max-size	Purpose	Return the size of the section. For a Woolz object, the size is dependent on the sectioning parameters
	Syntax	<code>Max-size</code>
	Response	<code>Max-size:width height</code> INT <i>width</i> The width in pixels of the section at the current scale INT <i>height</i> The height in pixels of the section at the current scale
	Example	<code>⇒OBJ=Max-size</code> <code>⇐Max-size:512 1024</code>
	Note	The size is dependent on the viewing plane defining parameters
Tile-size	Purpose	Return the size of a tile.
	Syntax	<code>Tile-size</code>
	Response	<code>Tile-size:width height</code> INT <i>width</i> The width in pixels of the tile INT <i>height</i> The height in pixels of the tile
	Example	<code>⇒OBJ=Tile-size</code> <code>⇐Tile-size:64 64</code>
	Note	The size is constant throughout the life of the server (see also section 6.4).

Wlz-true-voxel-size	Purpose	Returns the voxel size of the object.
	Syntax	<code>Wlz-true-voxel-size</code>
	Response	<code>Wlz-true-voxel-size:X Y Z</code> FLOAT <i>X</i> The x size FLOAT <i>Y</i> The y size FLOAT <i>Z</i> The z size
	Example	<code>⇒OBJ=Wlz-true-voxel-size</code> <code>⇐Wlz-true-voxel-size:2 1 2.2</code>
	Note	The voxel size is object specific, but view independent.
Wlz-volume	Purpose	Returns the volume of the object.
	Syntax	<code>Wlz-volume</code>
	Response	<code>Wlz-volume:volume</code> INT <i>volume</i> The volume of the Woolz object
	Example	<code>⇒OBJ=Wlz-volume</code> <code>⇐Wlz-volume:748</code>
	Note	The volume is object specific, but view independent.
Wlz-distance-range	Purpose	Returns the range of the sectioning plane distance.
	Syntax	<code>Wlz-distance-range</code>
	Response	<code>Wlz-distance-range:min max</code> FLOAT <i>min</i> The minimum distance FLOAT <i>max</i> The maximum distance
	Example	<code>⇒OBJ=Wlz-distance-range</code> <code>⇐Wlz-distance-range:-20 80</code>
	Note	The distance range is view-dependent.

Wlz-sectioning-angles	Purpose	Returns in degrees pitch, yaw and roll angles of the rotation of the sectioning plane.
	Syntax	Wlz-sectioning-angles
	Response	Wlz-sectioning-angles:pitch yaw roll FLOAT <i>pitch</i> The pitch angle of viewing plane rotation FLOAT <i>yaw</i> The yaw angle of viewing plane rotation FLOAT <i>roll</i> The roll angle of viewing plane rotation
	Example	⇒OBJ=Wlz-sectioning-angles ⇐Wlz-sectioning-angles:0 40 30
Wlz-3d-bounding-box	Purpose	Returns The first and last plane, line and column number of the object.
	Syntax	Wlz-3d-bounding-box
	Response	Wlz-3d-bounding-box:plane1 lastpl line1 lastln column1 lastcl FLOAT <i>plane1</i> The first plane number of the object FLOAT <i>lastpl</i> The last plane number of the object FLOAT <i>line1</i> The first line number of the object FLOAT <i>lastln</i> The last line number of the object FLOAT <i>column1</i> The first column number of the object FLOAT <i>lastcl</i> The last column number of the object
	Example	⇒OBJ=Wlz-3d-bounding-box ⇐Wlz-3d-bounding-box:0 10 -15 15 30 90
Wlz-coordinate-3D	Purpose	Returns the 3D object coordinates defined in 2D by the PRL command.
	Syntax	Wlz-coordinate-3D
	Response	Wlz-coordinate-3D:X Y Z FLOAT <i>X</i> The x coordinate FLOAT <i>Y</i> The y coordinate FLOAT <i>Z</i> The z coordinate
	Example	⇒OBJ=Wlz-coordinate-3D ⇐Wlz-coordinate-3D:20 30 10

Wlz-grey-value	Purpose	Returns in grey or RGB value of a point specified either the PRL or the PAB commands.
	Syntax	<code>Wlz-grey-value</code>
	Response	<code>Wlz-grey-value:grey</code> or <code>Wlz-grey-value:R G B</code> <code>INT grey</code> The grey value of the pixel <code>INT R</code> The red channel of the pixel <code>INT G</code> The green channel of the pixel <code>INT B</code> The blue channel of the pixel
	Example	<code>⇒OBJ=Wlz-grey-value</code> <code>⇐Wlz-grey-value:0 255 10</code>
	Note	The returned values are in the range of 0 to 255.

Object queries **Author**, **Copyright**, **Create-dtm**, **Subject** and **App-name** return *author/copyright/ create-dtm/ subject/ app-name unknown* since they are not defined for a Woolz object.

3 HTML query examples

Tile request

```
http://localhost/fcgi-bin/iipsrv.fcgi?
WLZ=/net/homehost/export/home/bill/pics/lobster3d.wlz&
QLT=50&JTL=1,0
```

Returns a jpeg tile 0 with the a quality factor 50%. The section default parameters, mode UP_IS_UP and zero distance and viewing angles are used.

Sectioning plane distance

```
http://localhost/fcgi-bin/iipsrv.fcgi?
WLZ=/net/homehost/export/home/bill/pics/lobster3d.wlz&DST=8&QLT=50&JTL=1,0
```

As above, but the sectioning plane distance is 8.

Sectioning mode, plane distance and angle

```
http://localhost/fcgi-bin/iipsrv.fcgi?DST=40&YAW=61.5&PIT=3&ROL=0&MOD=ZETA&
WLZ=/home/zsolth/small.wlz&QLT=50&CVT=jpeg
```

Returns the whole section with the distance 40, yaw angle 61.5, pitch 3, roll 0 degrees, for a plane at distance 40

Distance range query

```
http://localhost/fcgi-bin/iipsrv.fcgi?YAW=61&PIT=3&ROL=0&MOD=ZETA&
WLZ=/home/zsolth/small.wlz&OBJ=Wlz-distance-range
```

results in

```
Wlz-distance-range:0 171
```

4 WLZIIPSRV coding

4.1 Architecture

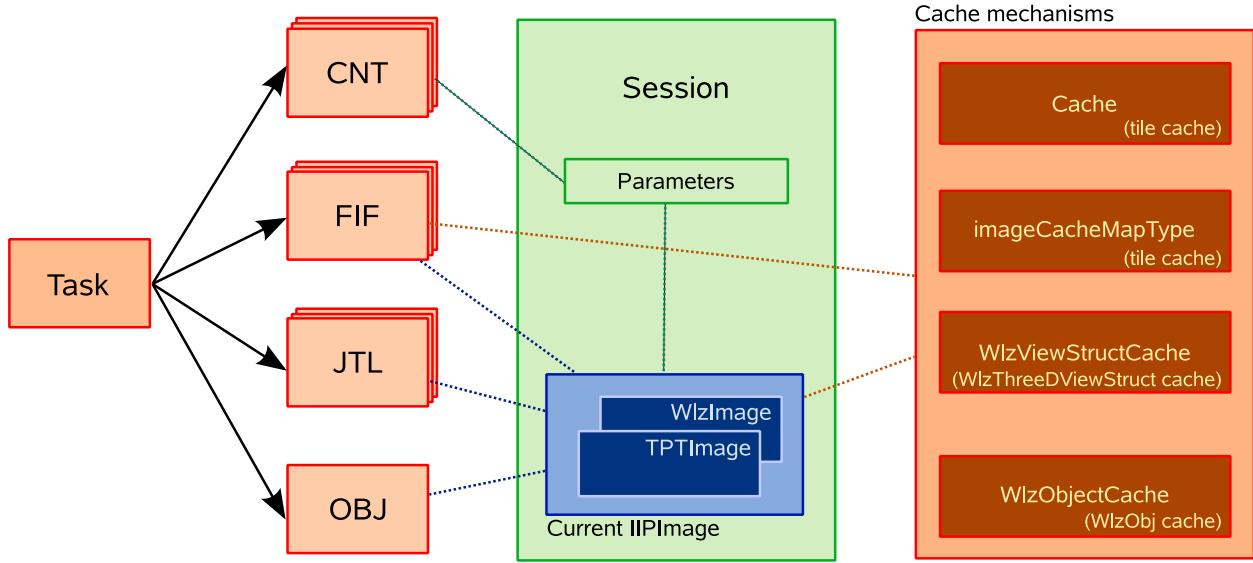

Figure 2: iipsrv version 0.9.7 architecture

Figure 2 depicts the architecture of the WLZIIPSRV this being inherited from the original IIPSRV and explaining both. Blocks in the figure represent either C++ classes or structures.

The **Task** class is the base of all command classes that serve independently each IIP command. Its static `factory(string type)` method creates an instance of the appropriate class that serves the `type` IIP command.

Figure 2 shows some of the classes implementing the IIP commands, all derived form the **Task**. Four command types can be identified:

Parameter setting commands such **CNT** and **ROL** pass a parameter to the server. The parameter value is stored by the command in the **Session** structure.

Object defining commands such **FIF** and **WLZ** receive the file name of an object and creates the necessary structures to handle an object. In WLZIIPSRV, either **TPTImage** and **WlzImage** classes store Tiled Pyramidal TIFFs and Woolz objects.

Image providers such **JTL** and **CVT** generate an tile or a full image corresponding to the previously set parameters, stored in the **Session** structure.

Parameter enquiry with **OBJ** command returns an parameter computed or previously specified.

The **Session** structure stores all session related parameters, including the current image object. To reduce the computation overhead, four types of caches are used:

- for tiles (`RawTile`),
- for flat images (`IIPImage`)
- for Woolz objects (`WlzObj`),
- and for Woolz view structures (encapsulated in `WlzThreeDViewStruct`).

The interactions between classes, figure 2, are multiple:

- task creates the requested command class,
- commands set session related parameters and the current object
- the **OBJ** command provides the current object parameters,
- before loading from disc, when an operation requires access object data the appropriate cache structure is checked first. Also, when a tile is requested, if its parameters result in a cache hit then the cached tile is returned. The a Woolz view structures are cached and looked before a section is generated.

Classes have been added to IIPServer and some of the original code had to be edited to fit them. However, these changes were kept to the minimum. The involved new and changed source code files as summarised below, however for details the doxygen documentation may be consulted.

4.2 Altered code

src/Makefile.am: added `WLZ.cc` and `WlzImage.cc` sources,

src/IIPImage.h: added `getHash()` virtual method,

src/IIPResponse.cc, src/IIPResponse.h: increased error buffer in `setError(const string&, const string)`; added `addResponse` with two and three double parameters,

src/Main.cc: added includes and `viewParameters` structure,

src/Task.h, src/Task.cc: added includes; `*viewParameters` for the current setting; Woolz related command handlers ,

src/OBJ.cc: added Woolz related handlers for parameter query commands; `checkifWoolz()` to check if a Woolz object

src/TileManage.cc: changed `crop(...)`: only if initial title has different size; `getImagePath()` replaced with `getHash()`,

/src/Environment.h added `getMaxViewStructCacheSize()`, `getMaxObjectCacheSize()`, `getWlzTileWidth()` and `getWlzTileHeight()` functions,

/Makefile.am: changed `crop`: crops only if initial title is different size; `getImagePath()` replaced with `getHash()`,

/configure.in: fixed two syntax errors: `fcgi-lib_path` changed to `fcgi.lib_path`; added brackets `FCGI_COMMON_CHECKS()`; `fcgi` files removed from `AC_OUTPUT`,

acinclude.ac: added brackets in `AC_DEFUN([FCGI_COMMON_CHECKS])`; new line added to the end of the file

other files all source files in the `src` directory have CVS strings added, however `fcgi` source files are not altered.

All source files with altered code include "Copyright (C) 2008 Zsolt Husz, Medical research Council, UK".

4.3 Extra code

For the WlzIIPSrv, the extra code added to the IIPSrv are located in:

WlzImage.cc*, **WlzImage.h***: implementation of sectioned image handling

WLZ.cc: **WLZ** load command implementation

WlzObjectCache.h: Woolz object caching

WlzViewStructCache.h: Woolz view structure caching

ViewParameters.h: section defining and query parameter structure

Main.dox, **Doxyfile**: doxygen documentation

4.4 IIPSrv and WlzIIPSrv beside the IIP specification

IIP ([I3A, 1997](#), p.25) defines a set of mandatory and optional commands that an IIP server should implements. The IIPSrv implements a subset of this commands, while also adds extra commands. WlzIIPSrv further extends the command set, while some of the original IIP commands are incompatible with Woolz objects.

The list of commands from Table 3 compares command sets of the IIP specification, the IIPSrv and the WlzIIPSrv with supported (S), unsupported (N), partially implemented (P) and commands in an unknown, an undocumented or nonfunctional state (U).

5 Woolz IIP Proxy

The Woolz IIP Proxy filters and forwards IIP requests to one or more WlzIIP servers. The requests conform the FCGI protocol. Though it was designated to work for IIP and Woolz requests, it is generic and can be applied to any FCGI request. Therefore, it is possible to chain multiple proxies.

The WlzIIPProxy is an independent program running on the proxy server. Apache2 server forwards the FCGI request to this sever, on a configurable port. WlzIIPSrv check the html request string (the FCGI_PARAMS packet QUERY_STRING parameter) and if any remote FCGI server definition string is a substring of the request then request is forwarded to this server. If there is

Table 3: Command and object request support by IIP protocol, iipsrv0.9.7 and WlzIIPSrv. S: supported; N: not supported; P: partially supported; U: unknown, an undocumented or nonfunctional

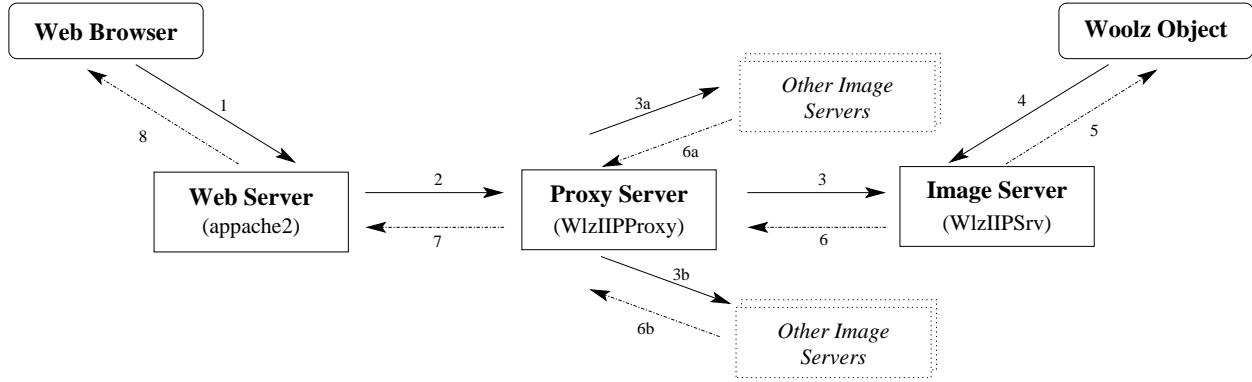

Figure 3: Architecture of Woolz IIP Server using a proxy server. The proxy forwards the user web requests served first by apache to the individual IIP Servers that have direct access to the Woolz Object. The numbered lines show the ordering of the requests (continuous line) and the replies (dotted lines).

no hit then the request is forwarded to the first FCGI remote server. The default setup of the WlzIIPProxy architecture is shown in figure3

5.1 WlzIIPProxy options

Usage:

```
WlzIIPProxy [-p<portnumber>] [-c<conf_filename>] [-l<log_filename>] [-v<loglevel>] [-h]
```

where the options are:

- -p Port number. Default value: 123777
- -c Configuration file containing WLZ name to server name mapping. Default value: WlzIIPProxy.conf
- -l Log file name. -v with a value greater than 0 must be used. Default value: /tmp/WlzIIPProxy.log
- -v Log level. Default value: 0
- -h Help, prints usage message.

The log level is 0 to 3 with

- 0 – no log,
- 1 – system startup, shutdown, error messages,
- 2 – as fcgi connection messages,
- 3 – as level 2 and received/sent packet types.

The configuration file has three columns for:

1. search string,
2. server name (or ip),
3. port number.

6 WlzIIPsrv installation

6.1 Install FastCGI

Download and install FastCGI [GNU \(2003\)](#). WlzIIPsrv was tested with fcgi-2.4.0 only.

```
cvs checkout -P src/Applications/WlzIIPsrv
```

6.2 Source code

Obtain the source files from the CVS repository.

```
cvs checkout -P src/Applications/WlzIIPsrv
```

6.3 Compiling

Run from the `WlzIIPsrv` root directory:

```
aclocal; automake; autoconf; ./configure; make
```

`configure` accepts `--with-wlz-incl` and `--with-wlz-incl` parameters that specify the location of either the Woolz installed libraries and includes or the Woolz source Core directory. The default directory is `../..../Core` relative to the `WlzIIPsrv` root directory that normally contains the Woolz source files. The Woolz libraries must be built before compiling `WlzIIPsrv`.

If the `fcgi` library can not be automatically located then `--with-fcgi-lib` and `--with-fcgi-incl` specify it. A static link of the `fcgi` library can be requested with `--enable-static-fcgi`. It requires `--with-fcgi-lib` to set the path of the static library.

Building was tested with GNU automake and aclocal v1.10, autoconf v2.61 and make v3.81.

For doxygen documentation run `make doc`. The documentation is generated into the `Docs` directory.

Installing implies moving the `src/iipsrv.fcgi` into the server's `fcgi` directory:

```
cp src/iipsrv.fcgi /srv/www/fcgi-bin/
```

Do not forget to set read and execute access modes!

6.4 Customisable parameters

In addition to the IIPSrv ([Pillay and Pitzalis, 1997](#), p.25) configuration parameters, WlzIIPSrv allows with the parameters from Table 4 changing the default cache and tile sizes.

Parameter	Description	Default value
MAX_WLZOBJ_CACHE_SIZE	Maximum Woolz object cache size in MBs	1024
MAX_VIEW_STRUCT_CACHE_SIZE	Maximum Woolz 3D view structure cache element number	1024
WLZ_TILE_WIDTH	Tile width in pixels	100
WLZ_TILE_HEIGHT	Tile height in pixels	100

Table 4: WlzIIPSrv extra configuration parameters

The example configuration from appendix B defines a view structure cache with 200 structures, a 1500MB Woolz object cache and 100×100 tile size.

7 WlzIIPProxy installation

- Download and compile / install FastCGI [GNU \(2003\)](#).
- Get WlzIIPProxy source code from the CVS repository:

```
cvs checkout -P src/Applications/WlzIIPProxy
```

- Configure and compile WlzIIPProxy: Run from the WlzIIPSrv root directory

```
aclocal; autoheader; automake; autoconf; ./configure; make
```

- Run WlzIIPProxy on the desired port and using the configuration file.

```
WlzIIPProxy -p <portnumber> -c <config_file>
```

- Configure apache2 on the web server:

1. install mod_fastcgi (you might need to reinstall apache2) **Note:** the mod_fcgi module, provided in SUSE 10.3 can not make remote FCGI request therefore is not compatible with WlzIIPSrv. mod_fastcgi must be used.

2. add to httpd.conf (/usr/local/apache2/conf/httpd.conf):

```
FastCgiExternalServer <virtual_path_to_fcgi> -host <hostname>:<portnumber>
```

A Example: Woolz IIP architecture on edradour

Follow the next step on the web server (**WS**), proxy server (**PS**) and WlzIIP server (**IS**) boxes.

1. **WS:** install apache2¹ and mod_fastcgi [GNU \(2007\)](#).
2. **WS:** Add to httpd.conf (/usr/local/apache2/conf/httpd.conf):

```
FastCgiExternalServer /srv/www/fcgi-bin/clusteriip.fcgi -host edradour:8000
```

3. **PS:** build WlzIIPProxy (see section [7](#))
4. **PS:** *Remark:* The libtiff library has to allow pyramidal tiff structures. If not, then FIF requests of TIFF images are note processed by the server. Add-hoc solution for this: the libtiff library² statically linked by editing Makefile.am, and replacing @TIFF_LIBS@ with /....libtiff/libtiff/.libs/libtiff.a.
5. **PS:** create configuration file wlziiproxy.cfg (assumed here to be at the same location as the executable) with:

```
***** node-07 8001
Kidney    node-01 8001
lobster   node-02 8001
```

This will use as default server node-07 while kidney requests are forwarded to node-01 and lobster requests are forwarded to node-02.

6. **PS:** start WlzIIPProxy

```
WlzIIPProxy -p 8000 -c wlziiproxy.cfg &
```

7. **IS:** download and compile / install libfcgi [GNU \(2003\)](#),
8. **IS:** build WlzIIPSrv (see section [6](#)) You might need to specify the location of Woolz and FastCGI:

```
./configure \
--with-fcgi-incl=/net/node-00/export/data0/home/zsolth/Proxy/fcgi-2.4.0/include \
--with-fcgi-lib=/net/node-00/export/data0/home/zsolth/Proxy/fcgi-2.4.0/libfcgi \
--with-wlz-incl=/opt/MouseAtlas/include --with-wlz-lib=/opt/MouseAtlas/lib
```

9. **PS:** start WlzIIPSrv

```
WlzIIPSrv --port 8001 &
```

10. **any browser:** test FCGI forwarding

```
http://finlaggan/fcgi-bin/clusteriip.fcgi
```

Here the finlaggan is the WS.

11. **any browser:** test WlzIIP request.

```
http://finlaggan/fcgi-bin/clusteriip.fcgi?DST=4&WLZ=/home/zsolth/Kidney.wlz&QLT=50&JTL=1,1
/home/zsolth/Kidney.wlz must be accessible from node-01 with o+r permission.
```

²available from <http://www.remotesensing.org/libtiff/> (branch-3-9)

B fcgi configuration

An example of the apache2 configuration (`/etc/apache2/http.conf.local`) is³

```
# Create a directory for the iipsrv binary
ScriptAlias /fcgi-bin/ "/srv/www/fcgi-bin/"

# Set the options on that directory
<Directory "/srv/www/fcgi-bin/">
    AllowOverride None
    Options None
    Order allow,deny
    Allow from all

    # Set the module handler
    AddHandler fcgid-script .fcgi
</Directory>

# Set our environment variables for the IIP server
DefaultInitEnv VERBOSITY "5"
DefaultInitEnv LOGFILE "/tmp/iipsrv.log"
DefaultInitEnv MAX_IMAGE_CACHE_SIZE "10"
DefaultInitEnv JPEG_QUALITY "50"
DefaultInitEnv MAX_CVT "3000"
DefaultInitEnv MAX_VIEW_STRUCT_CACHE_SIZE "200"
DefaultInitEnv MAX_WLZOBJ_CACHE_SIZE "1500"
DefaultInitEnv WLZ_TILE_WIDTH "100"
DefaultInitEnv WLZ_TILE_HEIGHT "100"
# Define the idle timeout as unlimited and the number of processes we want
IdleTimeout -1
DefaultMaxClassProcessCount 1
```
